**DETAILED ACTION**

***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1-4 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The use of "biologically active PAN6 polypeptide" in claim 1 renders the claims vague and indefinite because "biologically active" is defined by the specification (pages 23-24) as a modifier of the PAAD domain-containing polypeptide (PAN6, SEQ ID NO:24 in the instant case) and refers to a polypeptide that exhibits functional characteristics similar to at least a portion of (PAN6). The specification indicates several activities that are included, but leaves the definition open to other, unspecified and thus vague and indefinite, activities. Thus, the metes and bounds of the polypeptides encompassed by the phrase are unclear, especially with regard to PAN6.

Amending the claims to recite the specific biological activities intended to be encompassed would be remedial.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Claims 1, 3-4, and 15-16 are rejected under 35 U.S.C. 102(a) as being anticipated by NIH-MGC.

NIH-MGC teach an mRNA and a corresponding cDNA clone cloned into a vector, pCMV-SPORT6, and the vector in a host cell, MGC36 (Features section). The cDNA clone has the Accession Number of AW673661 which comprises a sequence that is 97.7% identical over a 571 nt length to SEQ ID NO:23. Because of the high sequence similarity over such a large length of nucleotides, it would specifically hybridize or hybridize under stringent conditions with the nucleotide sequence set forth as SEQ ID NO:23 or a nucleic acid that encodes SEQ ID NO:24. The cDNA clone reads a nucleic acid molecule that encodes a biologically active PAN6 polypeptide because the "biologically active" modifier is

specifically defined by the specification as including the ability to act as an immunogen for the production of polyclonal and monoclonal antibodies that bind specifically to an invention PAAD domain-containing polypeptide (PAN6) and the cDNA encodes such a long fragment of SEQ ID NO:24 (PAN6) that it is a fragment of PAN6 that would act as a specific immunogen for PAN6.
